CHAPTER 1 ■ Fundamental Concepts of Data Structure	1
1.1 ARRAY	1
1.1.1 Array Element in Memory	2
1.1.2 Initialization	2
1.1.3 Retrieving and Storing Some Values from/into the Array	3
1.2 STACK	11
1.2.1 Algorithm for Push Operation	13
1.2.2 Algorithm for Pop Operation	13
1.2.3 Algorithm for Traverse Operation	14
1.2.4 Algorithm for Peep Operation	14
1.2.5 Algorithm for Update Operation	15
1.3 QUEUE	22
1.3.1 Algorithm for Insert Operation	25
1.3.2 Algorithm for Delete Operation	25
1.3.3 Algorithm for Traverse Operation	26
1.3.4 Algorithm for Peep Operation	26
1.3.5 Algorithm for Update Operation	27
1.4 LINKED LIST	29
1.4.1 Single Link List	30

1.4.1.1 <i>Structure of the Node of a Linked List</i>	30
1.5 TREE	38
1.5.1 Questions	41
<hr/> <b>CHAPTER 2 ■ Concepts of Algorithms and Recurrences</b>	<b>43</b>
2.1 ALGORITHM	43
2.2 DESIGN OF ALGORITHMS	44
2.3 ALGORITHMIC NOTATIONS	45
2.3.1 Calculation for Method Calls	54
2.4 GROWTH OF FUNCTION	55
2.4.1 Asymptotic Notations	55
2.4.2 O – Notation (Big – Oh Notation)	55
2.4.3 ( $\Omega$ ) Omega Notation	56
2.4.4 ( $\Theta$ ) Theta Notation	57
2.4.5 o – Notation (Little–Oh Notation)	58
2.4.6 $\omega$ – Notation (Little-Omega Notation)	58
2.4.7 Comparison of Functions	58
2.4.7.1 <i>Transitivity</i>	58
2.4.7.2 <i>Reflexivity</i>	58
2.4.7.3 <i>Symmetry</i>	58
2.4.7.4 <i>Transpose Symmetry</i>	58
2.4.8 Summary	59
2.5 PROBLEMS RELATED TO NOTATIONS	59
2.5.1 Stirling's Approximations	61
2.6 RECURRENCES	64
2.6.1 Recurrence Relations	64
2.6.2 Substitution Method	65
2.6.3 Recursion Tree	68
2.6.4 Master Method	73
2.7 QUESTIONS	77
2.7.1 Short questions	77
2.7.2 Long Questions	77

CHAPTER 3 ■ Divide-and-Conquer Techniques	79
3.1 DIVIDE-AND-CONQUER APPROACH	79
3.2 BINARY SEARCH	79
3.2.1 Analysis of Binary Search	81
3.2.1.1 <i>Best-Case complexity</i>	82
3.2.1.2 <i>Worst-Case complexity</i>	82
3.3 MERGE SORT	82
3.3.1 Analysis of Merge Sort	84
3.4 QUICK SORT	85
3.4.1 Good Points of Quick Sort	85
3.4.2 Bad Points of Quick Sort	85
3.4.3 Performance of Quick Sort	88
3.4.3.1 <i>Worst Case</i>	88
3.4.3.2 <i>Best Case</i>	89
3.5 HEAP SORT	89
3.5.1 Building a Heap	90
3.6 PRIORITY QUEUE	98
3.6.1 Operations for Min Priority Queue	100
3.7 LOWER BOUND FOR SORTING	100
3.8 QUESTIONS	102
3.8.1 Short Questions	102
3.8.2 Long Questions	102
CHAPTER 4 ■ Dynamic Programming	105
4.1 DYNAMIC PROGRAMMING	105
4.2 DEVELOPING DYNAMIC PROGRAMMING ALGORITHMS	106
4.2.1 Optimal Substructure	107
4.2.2 The Principle of Optimality	107
4.3 MATRIX CHAIN MULTIPLICATION	108
4.3.1 Chains of Matrices	109
4.3.1.1 <i>How to Order Multiplications?</i>	109

4.4 LONGEST COMMON SUBSEQUENCE PROBLEM	138
4.5 DIVIDE AND CONQUER VS. DYNAMIC PROGRAMMING	141
4.6 QUESTIONS	141
4.6.1 Short Questions	141
4.6.2 Long Questions	141
<b>CHAPTER 5 ■ Greedy Algorithms</b>	<b>143</b>
5.1 GREEDY ALGORITHMS	143
5.1.1 Characteristics and Features of Problems Solved by Greedy Algorithms	143
5.1.2 Basic Structure of Greedy Algorithm	144
5.1.3 What Is Feasibility	144
5.1.3.1 <i>How to Prove Greedy Algorithms Optimal</i>	144
5.2 AN ACTIVITY – SELECTION PROBLEM	145
5.3 KNAPSACK PROBLEM	151
5.4 HUFFMAN ENCODING	154
5.4.1 Prefix-Free Code Representation	156
5.5 GREEDY VERSUS DYNAMIC PROGRAMMING	164
5.6 DATA STRUCTURES FOR DISJOINT SETS	165
5.6.1 Application of Disjoint Set Data Structures	166
5.6.2 Linked List Representation of Disjoint Sets	168
5.6.3 Disjoint Set of Forests	169
5.6.4 By Path Compression	171
5.7 QUESTIONS	173
5.7.1 Short Questions	173
5.7.2 Long Questions	173
<b>CHAPTER 6 ■ Graph</b>	<b>175</b>
6.1 TRAVERSAL OF GRAPH	175
6.1.1 Breadth First Search	175
6.1.2 Depth First Search	179

6.2 SPANNING TREE	180
6.2.1 Minimum Spanning Tree	181
6.2.2 Kruskal Algorithm	181
6.2.3 Prim's Algorithm	184
6.3 SINGLE-SOURCE SHORTEST PATH	188
6.3.1 Negative Weighted Edges	188
6.3.2 Relaxation Technique	188
6.3.3 Bellman–Ford Algorithm	189
6.3.4 Dijkstra's Algorithm	192
6.4 ALL PAIR SHORTEST PATH	195
6.4.1 Floyd–Warshall's Algorithm	196
6.5 QUESTIONS	203
6.5.1 Short Questions	203
6.5.2 Long Questions	204
<hr/> <b>CHAPTER 7 ■ Approximation Algorithms</b>	<hr/> 205
7.1 HAMILTONIAN CYCLE	205
7.2 APPROXIMATION ALGORITHMS	206
7.2.1 Traveling Salesman Problem	206
7.2.1.1 <i>Special Case of TSP</i>	206
7.3 BACKTRACKING	209
7.3.1 Hamiltonian Circuit Problem	210
7.4 N-QUEEN PROBLEM/8 – QUEEN PROBLEM	212
7.5 BACKTRACKING ALGORITHM	215
7.6 BRANCH AND BOUND	215
7.6.1 Knapsack Problem	216
7.7 QUESTIONS	220
7.7.1 Short Questions	220
7.7.2 Long Questions	221

CHAPTER 8 ■ Matrix Operations, Linear Programming, Polynomial and FFT	223
8.1 MATRICES	223
8.1.1 Operations with Matrix	224
8.1.2 Rank of a Matrix	227
8.1.3 Application of Matrices	231
8.1.4 Boolean Matrix Multiplication	231
8.2 POLYNOMIALS	234
8.3 POLYNOMIAL AND FFT	236
8.4 QUESTIONS	238
8.4.1 Short Questions	238
8.4.2 Long Questions	238
CHAPTER 9 ■ Number Theoretic Algorithms	241
9.1 NUMBER THEORETIC ALGORITHMS	241
9.2 GREATEST COMMON DIVISOR	243
9.3 LINEAR DIOPHANTINE EQUATIONS	245
9.4 MODULAR ARITHMETIC	246
9.5 LINEAR CONGRUENCE	247
9.5.1 Single-Variable Linear Equations	247
9.5.2 Set of Linear Equations	248
9.6 GROUPS	249
9.7 RING	251
9.8 FIELD	251
9.9 QUESTIONS	255
9.9.1 Short Questions	255
9.9.2 Long Questions	255

CHAPTER 10 ■ Programming Implementations of the Algorithms	257
10.1 PROGRAM FOR THE LONGEST COMMON SUBSEQUENCES	257
10.2 MATRIX CHAIN MULTIPLICATION	259
10.3 PROGRAM FOR KNAPSACK PROBLEM	261
10.4 BELLMAN–FORD PROGRAM	263
10.5 WRITE A PROGRAM FOR TRAVELLING SALESMAN PROBLEM USING BACKTRACKING	267
10.6 TRAVELING SALESMAN PROBLEM USING BRANCH AND BOUND	269
10.7 PROGRAM FOR HEAP SORT	271
10.8 PROGRAM FOR QUICK SORT	274
10.9 PROGRAM FOR MERGE SORT	276
10.10 PROGRAM FOR DFS	278
10.11 PROGRAM FOR PRIMS ALGORITHM	283
10.12 PROGRAM FOR THE WARSHALL METHOD	284
10.13 PROGRAM FOR THE KRUSKAL METHOD	285
10.14 PROGRAM FOR DIJKSTRA METHOD	287
10.15 BFS USING COLOR CODE	290
INDEX, 295

# Preface

---

After gaining a vast experience in the field of teaching, we decided to share our knowledge and the simplest way of teaching methodologies with the learners residing worldwide. This book is designed to provide fundamental knowledge about the theme of the algorithms and their implementations. No doubt in market a number of books related to this field are available, but the specialty of the current book lies in the emphasis on practical implementations of the respective algorithms through discussion of a number of problems along with its theoretical concepts, so as to enhance the skill of the learners.

This book is designed to provide an all-inclusive introduction to the modern study of computer algorithms along with its proper presentation and substantial intensity keeping in mind that it would be handy to all levels of readers. The area of expertise behind this book will familiarize simple concepts like recursion, array, stack, queue, link list, and tree to create an easy understanding of the abstraction of data structure. So, the depth of coverage or mathematical rigor is maintained along with the elementary explanations. Furthermore, each chapter of this book is designed with keen detailed presentation of an algorithm, its specific design technique, application areas and related topics to enforce simple understanding among the learners. Few algorithms that are primarily having theoretical interest are also provided with practical alternatives. Moreover, algorithms are designed using “pseudo-codes” to make it more interesting and comfortable for the learners. Each pseudo-code designed for respective algorithm leads to its clarity and brevity, which can further be translated in any programming language as a straightforward task. As we all know that visualization plays a major role in understanding complex concepts, this book also incorporates detailed working procedures of algorithms by using simple graphical images. All the algorithms in this book

are presented with a careful analysis of running times so as to maintain efficiency as a major design criterion.

The text material of this book is primarily intended to be used in undergraduate and graduate courses in algorithm design and data structure. However, the inclusion of engineering issues in algorithms design along with the mathematical apprehensions would make it more comfortable for self-study and well suitable for technical professionals too. Therefore, we look forward to provide the learners with an enjoyable introduction to the field of algorithms with the text material, its step-by-step description, and careful mathematical explanations to eradicate unfamiliarity or difficulty in the subject matter. Learners who have some familiarity with the topic are expected to find the organized chapters with soar preliminary sections proceeding towards more advanced materials.

This book comprises ten separate chapters. Chapter 1 puts forth the preliminary ideas about the concepts of data structures. Chapter 2 narrates the concepts of designing the algorithms and computing the complexities of algorithm as well as the idea about the recurrence relations. Chapter 3 describes the problems related to divide and conquer techniques with practical examples. Chapter 4 discusses the concepts and algorithms related to dynamic programming with appropriate examples. Chapter 5 covers the concepts and algorithms related to greedy choice with apposite examples. Chapter 6 centers on the concepts of different graph algorithms. Chapter 7 emphasizes the approximation algorithm with suitable examples. Chapter 8 deliberates the concepts of matrix operations, linear programming problems and polynomial classes. Chapter 9 highlights different theoretic algorithms. To conclude with, Chapter 10 demonstrates the programming implementations of all the cited algorithms using C-Language.

---

# Authors

---

**Dr. Sachi Nandan Mohanty** received his postdoctoral from IIT Kanpur in 2019 and Ph.D. from IIT Kharagpur in 2015, with an MHRD scholarship from the Govt. of India. He has recently joined as an Associate Professor in the Department of Computer Science & Engineering at ICFAI Foundation for Higher Education Hyderabad. Prof. Mohanty's research areas include Data Mining, Big Data Analysis, Cognitive Science, Fuzzy Decision Making, Brain-Computer Interface and Computational

Intelligence. Prof. S. N. Mohanty has received three Best Paper Awards during his Ph.D. at IIT Kharagpur from an International Conference on Computer Science & Information Technology at Beijing, China, and another at the International Conference on Soft Computing Applications organized by IIT Roorkee in 2013. He has published 20 research articles in SCI Journals. As a Fellow on Indian Society Technical Education (ISTE), The Institute of Engineering and Technology (IET), Computer Society of India (CSI), Member of Institute of Engineers and IEEE Computer Society, he is actively involved in the activities of the Professional Bodies/Societies.

He has been bestowed with several awards that include "Best Researcher Award from Biju Patnaik University of Technology in 2019," "Best Thesis Award (first Prize) from Computer Society of India in 2015," and "Outstanding Faculty in Engineering Award" from Dept. of Higher Education, Govt. of Odisha in 2020. He has received International Travel funding from SERB, Dept. of Science and Technology, Govt. of India for

chairing a session in international conferences held in the United States in 2020. Currently, he is the reviewer of various journals namely *Journal of Robotics and Autonomous Systems* (Elsevier), *Computational and Structural Biotechnology* (Elsevier), *Artificial Intelligence Review* (Springer) and *Spatial Information Research* (Springer). He has edited books published by Wiley, CRC Press, and Springer Nature.

**Mr. Pabitra Kumar Tripathy** completed his M.Tech. in Computer Science at Berhampur University, Odisha in 2009. He also completed an M.Sc. in Mathematics at Khallikote Autonomous College Berhampur, Odisha in 2003. He is currently pursuing his Ph.D. in Computer Science and Engineering at Biju Patnaik University of Technology, Rourkela, Odisha. He is working as the Head of Department in the Department of Computer Science and Engineering at Kalam Institute of Technology, Berhampur.

He has 15 years of teaching and academic experience. His areas of interest are Computer Graphics, Programming Languages, Algorithms, Theory of Computation, Compiler Design, and Artificial Intelligence. He also has published five international journals and has two patents. He has published five books for graduate students.

**Dr. Suneeta Satpathy** received her Ph.D. from Utkal University, Bhubaneswar, Odisha in 2015, with a Directorate of Forensic Sciences, MHA scholarship from Govt. of India. She is currently working as an Associate Professor in the Department of Computer Science at Sri Sri University, Cuttack, Odisha, India. Her research interests include Computer Forensics, Cyber Security, Data Fusion, Data Mining, Big Data Analysis, Decision Mining and Machine Learning.

In addition to research, she has guided many under- and post-graduate students. She has published papers in many international journals

and conferences in repute. She has two Indian patents in her credit. Her professional activities also include roles as editorial board member and/or reviewer of *Journal of Engineering Science*, *Advancement of Computer Technology and Applications*, *Robotics and Autonomous Systems* (Elsevier) and *Computational and Structural Biotechnology Journal* (Elsevier). She is also editor of several books on different topics such as Digital Forensics, Internet of Things, Machine Learning and Data Analytics published by leading publishers. She is a member of CSI, ISTE, OITS, ACM, IE and IEEE.

# Fundamental Concepts of Data Structure

---

## 1.1 ARRAY

---

Whenever we want to store some values, we have to take the help of a variable, and for this, we have to declare it before its use. For example, if we want to store the details of a student, we have to declare the variables as

```
char name [20], add [30];  
int roll, age, regdno;  
float total, avg;  
etc...
```

for an individual student.

If we want to store the details of more than one student, then we have to declare a huge number of variables that would increase the length of the program and create difficulty in its access. Therefore, it is better to declare the variables in a group, i.e., the name variable will be used for more than one student, roll variable will be used for more than one student, etc.

Therefore, to declare the variables of the same kind in a group is known as an Array. The concept of array can be used for storing details of more than one student or other objects.

- **Definition:** The array is a collection of more than one element of the same kind with a single variable name.

## 2 ■ The Art of Algorithm Design

- **Types of Arrays:**

The arrays can be further classified into two broad categories:

- One-dimensional (the array with one boundary specification)
- Multidimensional (the array with more than one boundary specification)
- One-Dimensional Array

Declaration:

Syntax:

Storage\_class Data type variable\_name[bound];

The data type may be one of the data types that we have studied. The variable name is also the same as the normal variable\_name, but the bound is the number that will further specify the number of variables that you want to combine into a single unit.

Storage\_class is optional. By default, it is auto.

Ex: int roll[15];

In the above example, roll is an array of 15 variables that can store the roll\_number of 15 students.

In addition, the individual variables are

roll[0], roll[1], roll[2], roll[3], ..., roll[14]

### 1.1.1 Array Element in Memory

The array elements are stored in consecutive memory locations, i.e. the array elements get allocated memory sequentially.

For Ex: int x[7];

If the x[0] is at the memory address 568, then the entire array can be represented in the memory as

x[0]	X[1]	X[2]	X[3]	X[4]	X[5]	X[6]
568	570	572	574	576	578	580

### 1.1.2 Initialization

The array is initialized just like other normal variables except that we have to pass a group of elements within a chain bracket separated by commas.

Ex: int x[5]={24, 23, 5, 67, 897};

In the above statement, x[0]=24, x[1]=23, x[2]=5, x[3]=67, x[4]=897.

### 1.1.3 Retrieving and Storing Some Values from/into the Array

Since the array is a collection of more than one element of the same kind, while performing any task with the array, we have to do that work repeatedly. Therefore, while retrieving or storing the elements from/into an array, we have to use the concept of looping.

Ex: Write a Program to Input 10 elements into an array and display them.

```
#include<stdio.h>
#include<conio.h>
int main()
{
    int x[10],i;
    clrscr();
    printf("\nEnter 10 elements into the array");
    for(i=0 ; i<10; i++)
        scanf(" %d ",&x[i]);
    printf("\n THE ENTERED ARRAY ELEMENTS ARE :");
    for(i=0 ; i<10; i++)
        printf(" %4d ",x[i]);
}
```

#### OUTPUT

```
Enter 10 elements into the array
12
36
89
54
6
125
35
87
49
6
THE ENTERED ARRAY ELEMENTS ARE : 12 36 89
54 6 125 35 87 49 6
```

```
/* PROGRAM TO INSERT, DELETE AND SEARCH OF AN
ELEMENT IN AN ARRAY*/
#include<stdio.h>
int insert(int *,int,int,int);
int delete(int *,int,int);
```

## 4 ■ The Art of Algorithm Design

```
void input(int *,int);
void display(int *,int);
int search(int *,int,int);
//method to search an element from an array
int search(int *array,int number,int find)
{
    int i;
    for(i=1;i<=number;i++)
    {
        //compare the number to search with array
        elements
        if(find == *(array+i))
        {
            return(i); //return the index
        }
        else
            if(i==number) //condition for not found
                return(0); //return 0 for failure
    }
}
//method to delete an element from an array
int delete(int *array,int number,int position)
{
    int temp = position;
    while(temp<=number-1)
    {
        *(array+temp)= *(array+(temp+1));
        temp++;
    }
    number= number-1;
    return(number);
}
//method to insert an element into an array at
desired location
int insert(int *array,int number,int position,int
element)
{
    int temp = number;
    while(temp>=position)
    {
        *(array+(temp+1)) = *(array+temp);
        temp -- ;
```

```
        }
        *(array+position)= element;
        number = number+1;
        return(number);
    }
/* INPUT */
void input(int *array,int number)
{
    int i;
    for(i=1;i<=number;i++)
    {
        printf("\nEnter the number");
        scanf("%d",array+i);
    }
}
/*OUT PUT */
void display(int *array,int number)
{
    int i;
    for(i=1;i<=number;i++)
    {
        printf("\nValue at the position %d : %d",i,* (array+i));
    }
}
/* main */
int main()
{
    int number,n;
    int *array;
    int position;
    int element;
    int find;
    char ch='y';
    printf("\nInput the number of element into
list");
    scanf("%d",&number);
    array = (int *)malloc(number * 2);
    input(array,number);
    printf("\nEnterd list");
    while(ch=='y' || ch=='Y')
    {
```

## 6 ■ The Art of Algorithm Design

```
display(array,number);
printf("\nEnter 1 for INSERT  2 for DELETE 3 FOR
SEARCH");
scanf("%d",&ch);
if(ch==1)
{
    printf("\nEnter the position to add the data");
    scanf("%d",&position);
    printf("\nEnter the value");
    scanf("%d",&element);
    number = insert(array,number,position,element);
    display(array,number);
}
else
{
    if(ch==2)
    {
        printf("\nEnter the position to delete the
data");
        scanf("%d",&position);
        number =delete(array,number,position);
        display(array,number);
    }
    else
    {
        printf("\nEnter the number to search");
        scanf("%d",&find);
        n=search(array,number,find);
        if(n!=0)
            printf("THE ENTERED NUMBER IS AT %d
POSITION",n);
        else
            printf("\nTHE NUMBER NOT FOUND");
    }
}
printf("\nDO YOU WANT TO CONTINUE[y/n] ");
fflush(stdin);
scanf("%c",&ch);
}
return 0;
}

OUTPUT
```

```
Input the number of element into list5
Enter the number12
Enter the number34
Enter the number54
Enter the number66
Enter the number76
Entered list
Value at the position 1 : 12
Value at the position 2 : 34
Value at the position 3 : 54
Value at the position 4 : 66
Value at the position 5 : 76
ENTER 1 for INSERT 2 for DELETE 3 FOR SEARCH3

Enter the number to search54

```

### OUTPUT

```
Input the number of rows:3
Input the number of cols:3
Enter a Number1
Enter a Number3
Enter a Number5
Enter a Number4
Enter a Number2
Enter a Number1
Enter a Number3
Enter a Number4
Enter a Number3

Entered array is as follows:
  1   3   5
  4   2   1
  3   4   3

Number rows  = Number of cols
Singular Test is possible

Determinant is : 25
Above matrix is not singular

## 1.2 STACK

---

Stack is a linear data structure that follows the principle of Last in First Out (LIFO). In other words, we can say that if the LIFO principle is implemented with the array, then that will be called the STACK.

The most commonly implemented operations with the stack are PUSH and POP.

Besides these two, more operations can also be implemented with the STACK such as PEEP and UPDATE.

The PUSH operation is known as the INSERT operation, and the POP operation is known as the DELETE operation. During the PUSH operation, we have to check the condition for OVERFLOW, and during the POP operation, we have to check the condition for UNDERFLOW.

- OVERFLOW

If one tries to insert an element in a filled stack, then that situation is called the OVERFLOW condition.

In general, if one tries to insert an element with a filled data structure, then that is called OVERFLOW.

### Condition for OVERFLOW

$\text{Top} = \text{size} - 1$  (for the STACK starts with 0)

$\text{Top} = \text{size}$  (for the STACK starts with 1)

- UNDERFLOW

If one tries to delete an element from an empty stack, then that situation is called the UNDERFLOW.

In general, if one tries to DELETE an element from an empty data structure, then that is called OVERFLOW.

### Condition for UNDERFLOW

$\text{Top} = -1$  (for the STACK that starts with 0)

$\text{Top} = 0$  (for the STACK that starts with 1)

### Examples

STACK[5]

0    1    2        3    4    top = -1 (CONDITION FOR EMPTY STACK)

### 1.3 QUEUE

---

Queue is a linear data structure that follows the principle of FIFO. In other words, we can say that if the FIFO principle is implemented with the array, then that is called the QUEUE.

The most commonly implemented operations with the Queue are INSERT and DELETE.

Besides these two, more operations can also be implemented with the QUEUE such as PEEP and UPDATE.

During the INSERT operation, we have to check the condition for OVERFLOW, and during the DELETE operation, we have to check the condition for UNDERFLOW.

The end at which the insertion operation is performed will be called the REAR end, and the end at which the delete operation is performed is known as the FRONT end.

- **Types of Queue**

- Linear Queue
- Circular Queue
- D – Queue (Double-ended queue)
- Priority Queue.

- **Linear Queue**

- OVERFLOW

If one can try to insert an element with a filled QUEUE, then that situation is called an OVERFLOW condition.

- **Condition for OVERFLOW**

Rear = size - 1 (for the QUEUE that starts with 0)

Rear = size (for the QUEUE that starts with 1)

- UNDERFLOW

If one can try to delete an element from an empty QUEUE, then that situation is called as UNDERFLOW condition.

- **Condition for UNDERFLOW**

Front = -1 (for the QUEUE that starts with 0)

Front = 0 (for the QUEUE that starts with 1)

- **Condition for EMPTY QUEUE**

Front = -1 and Rear = -1 [for the QUEUE that starts with 0]

Front = 0 and Rear = 0 [for the QUEUE that starts with 1]

## Examples

QUEUE[5]

0    1    2    3    4    front = -1 , rear = -1

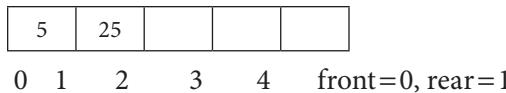

INSERT(5)

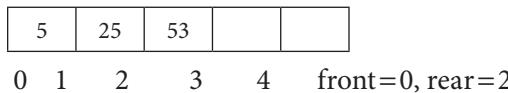

0    1    2    3    4    front = 0, rear = 0

## 1.4 LINKED LIST

---

The linked list is the way of representing the data structure that may be linear or nonlinear. The elements in the linked list are allocated memory randomly with a relation in between them. The elements in the linked list are known as NODES.

The link list is quite better than the array due to the proper usage of the memory.

- **Advantage of Link List over the Array**

The array always requires the memory that is in sequential order, but the linked list requires a single memory allocation that is sufficient to store the data. In the case of an array, the memory may not be allotted even if the available memory space is greater than the required space because that may not be in sequential order.
